

## Retrospective - Sprint 1

### Things that went well:

- Tickets provided clear tasks
- Completed tickets without running into major issues
- Created annotations to validate form

### Things that could have gone better:

- Missing ticket for environment set up
- More resources in tickets regarding setting up docker
- Created unit tests for newly implemented code

### Something I'd like to try to do differently:

- Try and do test driven development (TDD) in next sprint
- Create feature branches and do code review before merging into main branch
- Fill out API specification before implementation
